

# The Eelmazing Maze

Take the American eel through its journey to the Sargasso Sea so it can safely release its eggs.

 of Mainland Mi'kmaq

The American eel starts its life in the Sargasso Sea in the Atlantic Ocean. Then it floats and swims to rivers and streams across North and South America. It spends most of its life in freshwater. Once it is time to reproduce, it goes back to the Sargasso Sea. This is where it was born in saltwater. Help the American eel return safely to its breeding grounds. Predators are animals that feed on eels. The eel has very few predators. They are: porbeagle sharks, barracudas, grouper fish, humans and, sometimes, seabirds.

- The net represents humans; watch out so they don't catch you!
- Porbeagle sharks, keep your eyes open, they're one of the American eel's biggest predators!
- Barracudas, this nasty fish is hungry and loves to feed on eels.
- Grouper fish is a large fish with a large appetite. Eel is its favorite meal on the menu.
